# Day 4

- **Lab session : measurements of seeds' height**
    → Hanaé was separating the germs from the seeds
    → Maryam was taking pictures of the germs and added it on the gg drive for Nicolas and Noémie can analyse it on ImageJ
    → Nicolas and Noémie were measuring the height of all the germs on ImageJ software (thanks to the pictures that Maryam sent) and collected all the data on a google sheet

- **Brainstorming session : thinking about the best way to represent our data**
    → We decided to make pie charts on a first time to represent the dead germs, the germs that didn't grow and the germs that grew
    → We decided in a second time to make a graph that represent the height of the seeds in function of the caffeine concentration
    → In a third time , we decided to don't present the graph that represent the weight of the seeds in function of the caffeine concentration because our data wasn't relevant at all.

- **Data analysis session : weight and height**
    → We plot the data of the weight's measurements on ipython
    → We plot the data of the height's measurements on ipython
